The World Fertility Survey is an international research programme whose purpose is to assess the current state of human fertility throughout the world. This is being done principally through promoting and supporting nationally representative, internationally comparable, and scientifically designed and conducted sample surveys of fertility behaviour in as many countries as possible.

The WFS is being undertaken, with the collaboration of the United Nations, by the International Statistical Institute in cooperation with the International Union for the Scientific Study of Population. Financial support is provided principally by the United Nations Fund for Population Activities and the United States Agency for International Development.

This publication is part of the WFS Publications Programme which includes the WFS Basic Documentation, Occasional Papers and auxiliary publications. For further information on the WFS, write to the Information Office, International Statistical Institute, 428 Prinses Beatrixlaan, Voorburg, The Hague, Netherlands.

The views expressed in the Occasional Papers are solely the responsibility of the authors.
WFS Modules: Abortion • Factors other than Contraception Affecting Fertility • Family Planning • General Mortality

Prepared by:
WFS CENTRAL STAFF
International Statistical Institute
35-37 Grosvenor Gardens
London SW1W OBS, U.K.
The WFS Core Questionnaire for individual women which has been developed for the World Fertility Survey is just that: a core. It represents the minimum amount of information that a country might be expected to seek from its population of ever-married women of childbearing age. Most countries will wish to study certain topics in greater depth. To assist them in so doing, the WFS has prepared supplementary material, known as modules, which can be incorporated into the questionnaire. The modules deal with two kinds of variables: those which affect fertility directly, and those explanatory of fertility.

Abortion Module

1. INTRODUCTION

The Abortion Module, which consists of questions to be appended to Section 2 (Maternity History) and Section 3 (Contraceptive Knowledge and Use) of the WFS Core Questionnaire, recommends ways to obtain factual and attitudinal data on induced abortion.

There is no doubt about the important role which induced abortion can play in the determination of the level of fertility, not only theoretically, but also in practice, e.g. Japan, South Korea, Hungary, and several Latin American countries. Nonetheless, its satisfactory measurement is very difficult to achieve. Even in countries where abortions can be performed legally, official statistics give very unreliable estimates: Japan, for instance. It is still more difficult in those countries where induced abortion is illegal and, at least in theory, subject to penalty. In most countries strong social sanctions exist against induced abortion, and deter women from openly admitting their resort to it.

The validity of survey results on induced abortion can seldom be established because rarely do reliable records exist with which to compare them. In the rare cases where some kind of comparison was possible, survey results invariably proved to be deficient.

In the Hungarian National Fertility Survey of 1960–65, it was found that only 50–60 per cent of known abortions (compared with official registration data) were reported by the women surveyed. It was also found that older women were more reluctant to report their abortion experience than younger women, and rural women more reluctant than urban women.

In Taiwan one half of a sample of 2,200 women was asked directly whether they had ever had an induced abortion; the Randomized Response Technique (RRT) was administered to the other half. Among the group directly questioned 12.7 per cent admitted experience with abortion, whereas for those interviewed by RRT the corresponding estimate was 28.2 per cent: or more than twice as high. However, when RRT was administered to a small group of women known to have had abortions, the estimated proportion with abortion experience was only 40 per cent, implying a considerable amount of under-reporting even with RRT. Thus, even with a technique which had recently given rise to hopes for obtaining reliable data on induced abortion, satisfactory results cannot be guaranteed.

It may be asked why questions on induced abortion should be recommended for inclusion in

3. Christopher Tietze and Deborah A. Dawson, op. cit., p. 4.

4. For further information on the randomized response technique see Karol J. Krotki and Bonnie Fox, 'The Randomized Response Technique, the Interview, and the Self-administered Questionnaire: An Empirical Comparison of Fertility Reports', University of Alberta, August 1974.

the WFS surveys if the results of earlier surveys have not been satisfactory. Several reasons are offered:

1) It is safe to assume that abortion, though likely to be under-reported in varying degrees, will never be over-reported. Thus, whatever the figure on abortion obtained, it can be taken as the minimum.

2) Induced abortion, by its nature has a direct effect on fertility. Thus, to ignore it, even if the figure obtained be an underestimate, is to ignore an important determinant of fertility. The consequence of ignoring such a factor is more serious the more prevalent abortion is in a given country.

Suppose, for example, a survey indicates 20 induced abortions per 100 pregnancies, while the real figure is 35. Ignoring induced abortion would have resulted in omitting one of the factors which explain why the level of fertility is not, say, 20 per cent higher. Even if this figure on abortion (20) is not the right one, we see thus that it is nonetheless a very important figure without which fertility could not satisfactorily be analyzed.

Given the results from surveys in various places, it is clear that to have omitted questions on abortion in Greece, Greater Urban Santiago and South Korea would have been a serious mistake, even if we concede that these figures probably underestimate the true figures.5

</tr>
</tbody>
</table>

3) Even if the true incidence of induced abortion is underestimated, the observed patterns of differential resort to abortion by key demographic and social and economic characteristics of the women involved are remarkably consistent with theoretical expectations and, if interpreted cautiously (taking into account especially the probability of differential under-reporting), can yield insights into its role in accounting for their fertility differences. The accumulation of insights from a variety of social and cultural settings would go a long way towards improving our theoretical formulations about abortion behaviour, even as it would presumably improve a given country’s understanding of the abortion phenomenon among her own people.

Apart from the problem of deliberate under-reporting, induced abortions — and more generally foetal losses of all types — are subject to under-reporting due to such other problems as recall lapses. When dealing with the number of induced abortions, it is thus advisable to focus on events of recent years and to be cautious about figures obtained from older women in particular.

2. QUESTIONS TO BE APPENDED TO SECTION 2

The basic scheme of the module is to expand Section 2 (Maternity History) of the WFS Core Questionnaire (for countries of high fertility and low contraceptive usage) to include a series of probes that assist the respondent in recalling pregnancies that did not yield live births, followed by a question that asks about the manner in which each such pregnancy was terminated. Questions 224–234 presented below on pages 8 and 9 would replace Questions 224–233 of the WFS Core Questionnaire.

224. INTERVIEWER: TICK APPROPRIATE BOX (SEE 211, 221).

NO LIVE BIRTH AND NOT CURRENTLY PREGNANT □

NO LIVE BIRTHS BUT CURRENTLY PREGNANT □

AT LEAST ONE LIVE BIRTH □

(SKIP TO 229)

225. Have you ever been pregnant? (IF NO: PROBE. I mean, have you ever had a pregnancy even one that lasted just a few weeks or a few months?)

YES □

NO □

(SKIP TO 235)

226. Aside from your current pregnancy, have there been any other times you were pregnant? (IF NO: PROBE. I mean have you ever had a pregnancy that lasted for just a few weeks or a few months?)

YES □

NO □

(SKIP TO 235)

227. How many times have you been pregnant?

NUMBER ______

FOR EACH PREGNANCY ASK 230-234

228. How many such pregnancies have you had?

NUMBER ______

FOR EACH PREGNANCY ASK 230-234

IF ANY YESES TO 232, ADJUST 211.
### OTHER PREGNANCIES

|-------------------------------|--------------------------------------|-------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|--------------------------------------|

#### IF ANY PREGNANCIES IN AN INTERVAL

- **COLUMN 1**: Number of the interval in Column 1 for each such pregnancy and ask 230-234 for each pregnancy starting with the first.

#### COLUMN 2: MONTHS

- **COLUMN 3**: If less than 7 months, ask No.
- **COLUMN 4**: If 7 or more months, ask No.
- **COLUMN 5**: If 7 or more months, ask No.
- **COLUMN 6**: If 7 or more months, ask No.

#### QUESTIONS

- **COLUMN 1**: Month
- **COLUMN 2**: Year
- **COLUMN 3**: Months
- **COLUMN 4**: D.K.
- **COLUMN 5**: D.K.
- **COLUMN 6**: D.K.

#### 229. Before your first (between your first 8 second, etc.) child were there any times you were pregnant, even if only for a few weeks or months? How many such pregnancies were there in that interval?

- **COLUMN 1**: Month
- **COLUMN 2**: Year
- **COLUMN 3**: D.K.
- **COLUMN 4**: D.K.
- **COLUMN 5**: D.K.
- **COLUMN 6**: D.K.

#### 230. In what month and year did your (first, second such ...) pregnancy start?

- **COLUMN 1**: Month
- **COLUMN 2**: Year
- **COLUMN 3**: D.K.
- **COLUMN 4**: D.K.
- **COLUMN 5**: D.K.
- **COLUMN 6**: D.K.

#### 231. How many months did that pregnancy last?

- **COLUMN 1**: Month
- **COLUMN 2**: Year
- **COLUMN 3**: D.K.
- **COLUMN 4**: D.K.
- **COLUMN 5**: D.K.
- **COLUMN 6**: D.K.

#### 232. If 7 months or more, did that baby show any sign of life after it was born?

- **COLUMN 1**: Month
- **COLUMN 2**: Year
- **COLUMN 3**: D.K.
- **COLUMN 4**: D.K.
- **COLUMN 5**: D.K.
- **COLUMN 6**: D.K.

#### 233. If yes to 232, was the baby a boy or a girl?

- **COLUMN 1**: Month
- **COLUMN 2**: Year
- **COLUMN 3**: D.K.
- **COLUMN 4**: D.K.
- **COLUMN 5**: D.K.
- **COLUMN 6**: D.K.

#### 234. If less than 7 to 231: Did you, or a doctor or someone else do anything to end that pregnancy early?

- **COLUMN 1**: Month
- **COLUMN 2**: Year
- **COLUMN 3**: D.K.
- **COLUMN 4**: D.K.
- **COLUMN 5**: D.K.
- **COLUMN 6**: D.K.

#### 235. If yes to 234: For the baby a girl or boy?

- **COLUMN 1**: Month
- **COLUMN 2**: Year
- **COLUMN 3**: D.K.
- **COLUMN 4**: D.K.
- **COLUMN 5**: D.K.
- **COLUMN 6**: D.K.
3. QUESTIONS TO BE APPENDED TO SECTION 3

The following questions, A through E, are recommended (1) to probe once more in another context whether the respondent ever resorted to induced abortion, how often, and when; and (2) to measure the 'attitude climate' with regard to induced abortion. Both sets of questions, A–D and E, are best asked at the end of Section 3 (Contraceptive Knowledge and Use) of the Core Questionnaire, after Question 317. Placed there, they should facilitate discussion about induced abortion as a natural extension of earlier discussion about contraception. The attitude items in E would probably form a scale. The variations in attitude climate both within and between countries, measured by these items, could be analyzed in relation to the incidence of induced abortion.

A. Some women do something or have something done, either by a midwife or a doctor or some other way, to end a pregnancy that they do not want. They have an abortion. Has this ever been the case with you?

YES □ NO □ ← SKIP TO Q.E

VERIFY ANSWERS WITH INFORMATION OBTAINED IN THE LIST OF OTHER PREGNANCIES.

B. (IF YES TO Q.A): How many times? ————

C. In what month and year did the first (second, etc.) such pregnancy end?

IF DATE NOT KNOWN, ASK FOR INTERVAL IN WHICH THE ABORTION OCCURRED.

<table>
<thead>
<tr>
<th></th>
<th>Month</th>
<th>Year</th>
<th>Interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>1st pregnancy</td>

</tr>
<tr>
<td>2nd pregnancy</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Etc.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

D. Has there been any other pregnancy which was brought to an end because you did not want it?

Yes □ NO □

(CORRECT B AND ASK C) (Skip TO Q.E)

E. Assuming it were legal, would you approve or disapprove of women having an abortion by a doctor:
1. If the pregnancy is dangerous to her life?  
2. If the pregnancy is dangerous to her health?  
3. If the women has been raped?  
4. If there is good reason to believe that the child might be deformed or mentally defective?  
5. If the women is not married?  
6. If the couple cannot afford another child?  
7. If the women wants the abortion for any reason?

4. **NOTE ON INSTRUCTIONS TO INTERVIEWERS**

Some details about the way to record the pregnancies in the list of other pregnancies should go into the interviewer’s manual. Women will have a very different number of live births, and therefore the last interval will start with births of different order and can either be determined by the current pregnancy of the woman or by the date of interview. The determination of the interval is up to the interviewer. Only the first interval can be specified directly (it necessarily is before the first live birth, because all women who are asked Question 229 have had at least one live birth) and for subsequent intervals the specification has to be done by the interviewers. For whatever interval after the first the possible specifications are as follows:

- Between x and x + 1
- Between x and date of interview
- Between x and current pregnancy

Thus the interviewer should specify the number of the higher order live birth which determines the interval or write either ‘Interv.’ (for date of interview), or ‘Preg.’ (for current pregnancy).

**Example:**
- Between 2nd and 3rd
- Between 2nd and interv.
- Between 2nd and preg.

The number of pregnancies in each interval should be specified in the line reserved for that. No. x

As an additional check on the interval to which the pregnancies belong, the number of the interval specified under Question 229 should be written in the box in Column 1 for each pregnancy pertaining to that interval.

For the women with no live births (see 224) all other pregnancies should be classified as having occurred in the first interval, in Column 1 of the list of other pregnancies.
Module on Factors other than Contraception Affecting Fertility

I. INTRODUCTION

It is generally recognized that certain biosocial variables such as breast-feeding duration, post-partum amenorrhoea, post-partum abstinence from sexual relations, etc., can lengthen the interval between successive pregnancies. It is also known that customs regarding these variables may still be operating in many societies where modern contraceptive practices are not generally utilized. The problem is to obtain reliable data on these processes of subfecundity. The purpose of this module is to measure the effects of some of these biosocial variables in order to assess their impact on fertility.

The introduction to the module is divided into five sections. In the first section a description is provided of the variables which are included in the module, along with some indication of those variables which can be considered optional in contradistinction to those which are of primary importance. A discussion is included of the relative importance of the variables so that countries wishing to adopt the module will have a guide as to which portions or questions within the module are optional.

The second section contains a short description of the format of the module along with suggestions for integration of the module into the Core Questionnaire; the third and fourth sections contain interviewers' instructions for the module; and the last one contains notes for interviewers' training and a protocol for taking heights and weights.

1.1 VARIABLES INCLUDED IN THE MODULE

The process of fertility can be visualized in terms of three events: 1) sexual intercourse, 2) conception, and 3) parturition. Variables included in this module mitigate the occurrence of these three events and can be grouped accordingly as follows.

1.1.1 Factors which mitigate exposure to sexual intercourse

A. Separation of the partners

It is desirable to adjust pregnancy intervals for periods of temporary separation of the partners, especially in countries where prolonged male emigration related to employment is common. The questions will provide information on the duration(s) of temporary separation(s) for the last (open) and penultimate (closed) pregnancy intervals. The minimum period for any absence is three months. It is recognized that information on temporary absences may

be unreliable due to recall lapse and to infidelity when the partner is absent; however, the information obtained can be a measure of a variable which can have a significant effect on a woman’s fertility.

B. **Coital frequency**
Specific questions on coital frequency have been included for currently married women. The time reference for the question is the usual frequency per week. The question on coital frequency is optional because it is sensitive and can cause the respondent embarrassment or arouse her antagonism. However, the question has been included since differences in coital frequency among couples can have a significant effect upon fertility.

C. **Voluntary terminal abstinence**
In some countries the prevalence of terminal abstinence, that is, voluntary cessation of sexual intercourse even though a woman is still fertile, can have a significant effect on fertility. We obtain information on the expectation of the resumption of sexual activity as well as the reason for abstaining in order to classify women who are abstaining permanently.

D. **Post-partum abstinence from intercourse**
All women are asked when they resumed sexual relations after a pregnancy termination, irrespective of pregnancy outcome. Months have been specified as the unit; in some countries where there is a customary period specified in days, the unit of the answer should be changed. The name for the period of customary abstinence should be used whenever possible. Use of the name for this period and rephrasing of the question by asking the respondent how long the period was for her can reduce her embarrassment. (Note: the interviewers’ instructions will have to be appropriately modified when the name for post-partum abstinence is used in the question).

1.1.2 Factors which mitigate exposure to conception

A. **Breast-feeding duration**
Breast-feeding duration is measured for the last and penultimate pregnancies. These questions on the total duration of breast-feeding are considered by WFS to be required variables. A question is included on the duration of full breast-feeding, i.e., the duration of the period when breast-milk is the only food given, but this question is optional. Its inclusion is recommended because full breast-feeding duration is a measure of adequate nutrition for a child as well as of suppression of ovulation in the mother. The initiation of partial breast-feeding i.e., the end of full breast-feeding, is defined as the date when the mother begins to give the child other foods along with breast-feeding.

B. **Duration of post-partum amenorrhoea**
This question follows the questions relating to breast-feeding. Theoretically it should be
acknowledged that a woman's first cycle(s) after confinement may be anovulatory. Anovulatory first cycles are dependent on many factors such as the intensity of breast-feeding, as well as the time since birth of the infant. However, laboratory analyses are required for the determination of ovulation, and therefore anovulatory cycles cannot be considered in this type of survey; only date of first menstruation after parturition can be measured, and we assume that a woman is fertile from the onset of menstruation.

C. Contraceptive use
The module replaces Section 5 of the Core Questionnaire so that contraceptive use in the closed and open pregnancy intervals is measured.

D. Maternal nutritional status
It is not within the scope of the WFS to assess directly the health or nutritional status of respondents. However, since nutritional status has a direct relationship to fecundity we have incorporated the measurement of height and weight as minimal estimates of nutritional status since these measurements are relatively easy to obtain. In addition, height and weight measures have been utilized to derive an estimate of the amount of body fat a woman has. Minimum levels of body fat are necessary for menstrual functioning and pregnancy.
We consider the measurement of height and weight to be optional. Some changes in sample design may be necessary since these anthropometrics are more easily measured on a clustered sub-sample of the WFS sample population.
Other variables related to menstrual functioning should be measured when height and weight are measured. Some of these variables are necessary even when height and weight are omitted from the module; these are indicated in the description that follows:

1) Menarche: This variable should be ascertained to the nearest month, if possible.
2) Cycle length and duration of menstruation: The questions concern regularity and duration of menses, which is assumed to be correlated with nutritional status as well as fecundity. This series of questions is optional and need only be included if heights and weights are measured.
3) Menopause: Women who have not been sterilized and who think that it is physically impossible to have another child are asked if they think they are menopausal. We recommend that this question be included, even when height and weight are omitted, because of its relationship to fertility.

1.1.3 Factors which mitigate gestation and successful parturition
Perinatal mortality, although not a part of the module, is included in the pregnancy history and is highly relevant to this module. Interviewers should be trained to probe carefully in order to obtain data which are as accurate as possible on details concerning perinatal loss and infant mortality.

1.2 LENGTH AND FORMAT OF THE MODULE

An earlier version of this module was pre-tested by Dr. Pierre Cantrelle in Zaire on a sample of 50 women. A revised version was then pre-tested in Malaysia in cooperation with the Department of Statistics in January 1975. A purposive sample of 107 interviews was completed with 63 interviews done in a rural area and 44 done in Kuala Lumpur. The revised version based upon the Malaysian experience was pre-tested during the WFS pilot survey in Ghana in August 1975 in cooperation with the Regional Institute for Population Studies. A total of 643 interviews were obtained from one urban and three rural areas. This module reflects the experience derived from the three pre-tests.

The module is based on pregnancy intervals rather than the live birth intervals dealt with in the Core Questionnaire. Thus, the information on breast-feeding duration and contraceptive use for the penultimate and last pregnancies will not be strictly comparable to the same information derived from the Core Questionnaire for penultimate and last live births. However, the focus of the module is such that information on pregnancy intervals rather than live birth intervals is essential in order to compare the effects of factors such as breast-feeding duration, post-partum abstinence and amenorrhoea duration, on both live and non-live births.

The module is constructed so that it can be easily incorporated into the Core Questionnaire. Most of the questions in the module are contained in Section 5. Thus, the module version of Section 5 contains all the questions in this section of the Core Questionnaire plus the questions of the module itself. Several questions are then added to other sections: age of menarche is added to Section 2; two questions on sterilization are added to Section 3; questions on coital frequency and terminal abstinence are added to Section 4; and height and weight can be measured at the end of the interview (Section 7).

It is essential also that the marriage history section of the Core Questionnaire precede Section 3 (contraceptive knowledge and use) when the module is used.

An integrated pregnancy history was used when the module was pre-tested. In this form all live births plus other pregnancies in each birth interval are obtained in an ordered list. Use of an integrated pregnancy history facilitates use of the module and countries adopting the module may wish to use the integrated pregnancy history format. An alternative to a completely integrated format is that used in the WFS survey in Fiji: the pregnancy history contains probes for additional pregnancies between the last two live births and after the last birth. WFS suggests these alternatives because of the importance of obtaining accurate information on pregnancy loss in general and, in particular, on the last two pregnancies which are the focus of this module.

Countries wishing to adopt the module should take into consideration the fact that widows are asked questions on breast-feeding, post-partum amenorrhoea, and abstinence duration for the open interval. These questions may be very sensitive for them. The same questions are asked for the last closed interval so widows can be filtered out of the open interval, i.e., they would be asked these questions for the last closed interval only.
The questions on breast-feeding in Section 2 will have to be deleted since they have been incorporated into the module. In addition, a minor change has to be made in the allotment of coding boxes in the birth history in Section 2. At present, one box is allotted for the number of months or years a child survived. WFS recommends two digit coding (2 boxes) for this variable when this module is used so the lifespan of the child will be coded to the nearest month. (Details of the coding of this variable are available in the Editing and Coding Manual, Basic Documentation No. 7.

WFS estimates, based upon pre-tests of this module, that adding it to the Core increases the interview duration by 10 to 15 minutes.

1.3 INTERVIEWERS' INSTRUCTIONS FOR SECTION 3

Q.320: Refer to Q.314 and Q.318 for the first part of this filter. Note that it doesn’t matter why a woman has been sterilized (for example ‘NO’ in 315); the fact that she has been sterilized is the important consideration, so you will circle ‘Yes’ if the answer to 314 is positive.

1.4 INTERVIEWERS' INSTRUCTIONS FOR SECTION 5

In this section we obtain information on the following related topics:

1) Breast-feeding duration
2) Post-partum amenorrhoea duration
3) Post-partum abstinence duration
4) Duration of temporary absences of spouses
5) Contraceptive usage
6) Menstruation characteristics
7) Desired number of children

Information on items 1 through 5 is confined to the last closed and the open pregnancy intervals. These intervals are defined as follows:

**Last closed pregnancy interval**: The interval between a woman’s next-to-last (penultimate) pregnancy and her last pregnancy.

1) If a woman is currently pregnant her last closed pregnancy interval is the period from her last pregnancy to the date when her current pregnancy is expected to end.

2) If a woman has had only one pregnancy, or is currently pregnant for the first time, her last closed pregnancy interval is the time from her date of marriage to the birth date or the expected end of the current pregnancy.

---

16
3) If a woman has never been pregnant she does not have a closed pregnancy interval.

**Open pregnancy interval:** The open pregnancy interval is the time since the woman’s last birth (live or non-live).

1) Women who are currently pregnant do not have an open interval; they are currently in a closed interval.
2) Women who have never been pregnant are in an open interval which began at their date of marriage.

The following diagram should clarify these definitions:

**Women not currently pregnant at interview date**

Has had more than two pregnancies

Has had two pregnancies

Has had only one pregnancy

No pregnancies

**Women currently pregnant at interview date**

At least one pregnancy before

Current pregnancy is first one

M = Marriage date
P = Pregnancy termination (with or non-live birth)
I.D. = Interview Date.
As you can see from this diagram the last closed and open intervals change slightly depending upon whether a woman is currently pregnant or not.

The questions in Section 5 are grouped by pregnancy interval as is shown in the table below:

<table>
<thead>
<tr>
<th>INTERVAL</th>
<th>QUESTIONS</th>
<th>CHARACTERISTICS OF WOMEN WHO WILL BE ASKED THE QUESTIONS IN THE SECTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Open</td>
<td>507–525</td>
<td>(A)* Women not currently pregnant who have had one or more pregnancies</td>
</tr>
<tr>
<td>Last Closed</td>
<td>527–548</td>
<td>(A)* Women not currently pregnant who have had two or more pregnancies</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(B) Women currently pregnant who have had one or more previous pregnancies</td>
</tr>
<tr>
<td>Open and Closed</td>
<td>549–559</td>
<td>(A) Women who have never been pregnant</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(B) Women currently pregnant for first time</td>
</tr>
</tbody>
</table>

* Note that women who are not currently pregnant and who have had two or more pregnancies will go through both the Open Interval questions AND the Last Closed Interval questions. Thus they will be asked the same questions twice about two different births (last and next-to-last).

Before beginning a discussion of the questions themselves, it will be necessary to define the terms and concepts you will be using in this section.

Post-partum: the period of time after the birth, post = after; partum = a bringing forth.

Post-partum amenorrhoea: a cessation of menstruation, usually temporary, occurring after a birth.

If a woman breast-feeds she may not resume menstruation for a year or more after the birth. Menstruation IS NOT the normal bleeding which occurs for several weeks after birth. This is a part of the delivery and this time is a part of the post-partum amenorrhoea duration.

Post-partum abstinence: refraining from sexual intercourse after the birth of a child.

Menopause: the permanent cessation of menstruation (in contrast to post-partum amenorrhoea). It can occur in women 35 years old, but usually occurs between ages 40–50.
Full breast-feeding: the child is fed only breast milk.
Partial breast-feeding: the child is given other foods, usually cereal to begin with, in addition to breast milk.
Temporary absences: husband’s absences which are NOT permanent (divorce or separation is considered permanent and is dealt with in the marriage history section).

Qs. 501–506
This is a table for you to complete before you begin asking the next set of questions. Refer to the live birth and pregnancy tables in Section 2 in order to complete this table correctly. You will need to refer to this table in order to obtain the correct information in Section 5.

First example:
Assume a woman is currently pregnant, had a live birth in 1970, and had a 6-month pregnancy which ended in a non-live birth in June 1972. These are her only pregnancies. You will check Q.221 (226, revised Core) and ascertain that she is currently pregnant. You will circle box 2, CURRENTLY PREGNANT in 501, then skip to 504. You will circle ALL OTHERS, box 3 in 504, circle NON-LIVE BIRTH, box 3 in 505, and record ‘June 1972’ in 506. You will ignore the live birth in 1970 because you will not be concerned with that birth in Section 5.

Second example:
Suppose the respondent has had three live births, no non-live births, and she is not currently pregnant. Her last (most recent) child died a few hours after he was born. Her next-to-last child is still alive. You don’t need the information on her first live birth. Thus, you circle ‘ALL OTHERS’ in 501, circle ‘LIVE BIRTH CHILD DEAD’ in 502, and record the date of birth of the child who died (and name if given). Then you will circle ‘ALL OTHERS’ in 504, ‘LIVE BIRTH CHILD ALIVE’ in 505 and record the date of birth and name of the child in 506.
Note that in 503 and 506 there is a space for you to record ‘YEARS AGO’ if the respondent doesn’t know the child’s birth date.
TWINS: The birth of twins is actually one live birth so you will record both names in either 503 or 504. You will ask the total length of breast-feeding for both children in the same question. For example, if twins are her most recent birth (last) you will record the duration in Q.509. If both were breast-fed the same amount of time you will record, for example, ‘14 for both’.

Qs. 507–526: Open interval
Q.507: Refer to table in 501–506 in order to circle the appropriate boxes.
Qs.508–511: Breast-feeding

Q.508: In this and the other questions with a place to use the child’s name, do so as often as possible so the woman will know whom you are talking about. You can easily refer to the tables in 501–506 for the name. For this question you will use the child's name you recorded in 503.

Q.509: What is wanted is the total time a woman breast-fed her child. If a woman breast-fed the child, say, only at night for the last six months of breast-feeding then those six months should be included in the total. Note that in this and many of the questions to follow, the answer is in MONTHS. If the respondent says one year you write 12, if she says one-and-a-half years you write 18; you must record the answer in months.

Q.510: This is a probe to be certain you have her total duration of breast-feeding.

Q.511: In this question you want to know when she began partial breast-feeding (see definition). This information may be difficult to obtain and you may have to probe.

Q.512: Post-partum abstinence

Often the woman will answer (by using a particular term) that she observed a customary period of abstinence. Probe by asking how long this time was, if she uses a term.

Q.513: Post-partum amenorrhoea

This question does not refer to post-partum bleeding (see definitions). You want her first normal menstrual period after the birth of the child.

Qs.514–515: Post-partum abstinence and amenorrhoea for non-live births. These questions are similar to Q.512 and Q.513 except you will NOT probe by asking how old the child was because the pregnancy ended in a non-live birth.

Qs.516–520: Contraceptive use

Q.516: You will have to refer to several places to fill in this filter. First refer to 401 and 405 to determine if she is currently married, then refer to the appropriate questions, 512 or 514, to see if the woman has resumed sexual relations and then refer to 320 to determine if she has ever used contraception or been sterilized.

Q.518–520: The method she has used most recently must be recorded in 520. Method means any method of contraception. It does not need to be a method such as the pill, loop, or condom which requires supplies or help from a doctor. It may be any other method such as rhythm or abstinence, etc., listed in Section 3. If the respondent is consistent she should mention in 518 or 520 only from among the methods she has mentioned as having ‘EVER USED’ in Section 3. Use the respondent’s own words to describe the method she mentions.

Q.519: Use the name of the child whenever possible.
Qs.521–526: Temporary absences

Q.521: We want to determine whether the husband has been away for three months or more. Be sure to stress the words THREE MONTHS. Even if the husband was only looking for work for three months, the fact that he was away is important and must be recorded in the table.

Q.522: Check to be sure that the date she gives you is a date after her last (most recent) pregnancy.

Qs.523–525: In this table you will record the length of each absence.

Q.523: If the respondent replies in years, for example one year, you will record ‘12’.

Q.524: If the respondent says ‘NO’, you will have to probe and correct 523. For example she may say, ‘My husband was away for 6 months, he came home for two weeks, then was gone for six months again’, you will circle ‘NO’ in 524, then draw a line through 12 (12) in 523 and write ‘6’; then you will circle ‘Yes’ in 525 and write 6 on the next space below (523). Ask 524 by referring to the second six-month period and continue.

Sometimes you will get cases where she will say her husband was away 3 or 4 months and, after asking 524 and probing, you will learn that he came home every other weekend. Draw a line through the answer in 523, and leave it since he was never away for a whole month. Then proceed to 525.

Qs.527–548: Last closed interval

These questions are duplicates of Qs. 507–526 except for a few minor differences detailed below.

Qs.527–528: Use Q.504–505 to circle the correct boxes in this filter.

Q.547: This is a further check on absences. If the woman responds ‘YES’ skip to 560.

Qs.549–559: Open and closed intervals

Since these women are either pregnant for the first time or have never been pregnant you are obtaining information only on contraceptive use and on temporary absences. The questions are the same as those for the open interval.

Qs.560–565: Menstrual characteristics

Q.560: You are asking if her periods are USUALLY regular.

Q.562: You want the total duration of her period generally. Some women may misunderstand and think that you mean the time BETWEEN menstrual periods. If you get an answer of more than 9 days explain your meaning by saying that you want the duration of bleeding.

Q.563: Check questions 320, 501, and 401, 405, in order to circle the correct boxes.

Q.564: This question is about the physical capability of having a child, and not whether she wants to have a child. You must stress the phrase ‘supposing you wanted one’. The category ‘D.K.’ has been omitted because you are to circle ‘YES’ if she doesn’t know. Thus, you will circle ‘NO’ only if the answer is definitely ‘NO’, that is, if the respondent is certain that she
and her husband are not capable of having a child, even if they wanted one.

Q.565: We are asking for whether she thinks she is at the menopause.

Qs.566–574: Ideas about family size

Q.566: Be sure to circle this filter correctly. Note that we have underlined LIVE BIRTHS. If a woman has had only non-live births and no LIVE BIRTHS then you will circle ‘NO LIVE BIRTHS’.

Q.567: This is asked of currently pregnant women. The purpose of this question is to find out if the respondent would like to have another child at any time in the future. She need not at present have definite plans for another one, nor is it necessary that she wants it soon after the expected child.

Q.568: You are asking for how many MORE children AFTER the one she is currently expecting. Thus the respondent should not include any she has already and should not include the one she is currently expecting.

Q.569: This is for women who haven’t had any live births. See notes on 567.

Q.570: ‘Either’ means that she does not care whether her next child is a boy or a girl. If she gives some other answer such as ‘it depends upon God’ or ‘it is up to my husband’, then you must write it clearly, using the respondent’s own words as far as possible.

Q.571: See notes on 567.

Q.572: See notes on 570.

Q.573: See notes on 568.

Qs.574–576: Intended contraceptive use

Be sure to check 320 for the filter 574. Question 575 is to be asked of all women who have NEVER used a contraceptive method.

Q.576: This question is asked of all respondents. You should give a short pause asking 576. You may preface the question by saying ‘Finally one more question on this topic. . .’. This question is not the same as 568, although you may get the same answer. Here you are asking for the total number of children she would really like to have ‘if she could choose exactly’, irrespective of whether she can accomplish it, and irrespective of the number of children she already has. If she asks you what you mean by ‘choose exactly the number of children’, you simply say that the phrase means just what she thinks it means. For example, if she thinks it refers to a time when she was younger and just married, or to a time when her husband did not have any trouble with his job which he may be having now, or to a time when her or her husband’s health was better, etc., she can take it to mean whatever she likes, but you yourself must not suggest anything.

Try to get as precise an answer as possible. If she cannot give a precise answer, write down the range, or other answer in her words. If she says ‘It is up to God’ or ‘Whatever my husband wishes’ record the answer in her own words.
1.5.1 Equipment
The best scales to use are (hospital or clinic) beam balance scales. However, these scales are expensive and are often too heavy to be truly portable in a field situation. The second choice is good quality (bathroom) spring scales. The WFS has used spring scales made of steel, with large dials approximately 10 cm. in diameter. The dial face is turned around prior to use so that the numbers are upright for the interviewers rather than the respondent. The dial should be such as to be easily read by the interviewer in order to keep interviewer variability to a minimum. Two lines which indicate placement of the heels of the respondent should be painted about 2 cm. from the edge of the base. The unit of the scale is kilograms, divided into tenths. A horizontal aperture is drilled into the base of the scale 0.5 cm. below the standing surface for attachment of the height measure. The scale weighs about 1 kg. and is portable for normal walking distances.

Spring scales must be calibrated daily. An easy method for maintaining calibration under field conditions is to carry a water container which, when filled with water, has a known weight. This can be filled and set on the scales for calibration.

Height measures can also be adapted for the field situation. A long lightweight wooden stick can be marked in centimeter units and a movable horizontal bar can be attached to the measure. This method facilitates accurate measurement of height since the respondent can place her heels against the wall and thus will be more likely to stand erect.

An alternative the WFS has used is metric steel tape measures. It is essential that these measures should have certain features. The reel should lock into place after the tape is pulled out to the length desired, and the tape measure should have an automatic rewind mechanism. A 20 cm. long horizontal bar is mounted onto the case of the steel tape measure. In order to ensure accurate placement of the horizontal bar across the top of the respondent’s head, a spirit level should be attached to the horizontal bar. When these steel tape measures are used, a horizontal aperture is drilled into the base of each weighing scale, 0.5 cm. below the standing surface for attachment of the height measure. Then the steel tape measure is hooked into the aperture and drawn up to measure the respondent’s height while she is standing on the scale. (A steel tape measure with these specifications is now commercially available.)

1.5.2 Training
Training is relatively straightforward. Instructions for the interviewers should include the following items and a copy should be passed out to each interviewer. In addition, a chart should be made so that interviewers can record heights and weights for practice.

Interviewers' notes
The following instructions assume use of spring scales and metric steel tape measures.
A. **Weight measurement**

1) Find as level a floor as possible and put the scale down on it.

2) Check the weight indicator on the scale. Set it to zero if it is off zero. (After calibration of scales, you may be instructed always to set your scale to some unit other than zero.)

3) Ask the respondent to stand, with her shoes off, with her heels on the indicated places on the scale. Tell her to stand as straight as possible, with her arms hanging at her sides. Tell her to look straight ahead so she will be standing straight. You will tell her her weight later so she doesn’t have to look.

4) Stand directly over the dial face to read the weight. Do not stand to one side of the dial when reading weight.

5) Record the weight to the nearest tenth of a kilogram, for example: 55.2 kg., should not be rounded to 55.0 kg.

B. **Height measurement**

1) Ask the respondent to remain standing on the scale. Have her stand comfortably, arms at her sides, looking straight ahead. (If a commercial steel tape height measure or wooden rod is used, she should stand with heels against a wall.)

2) Attach the tip of the tape measure to the base of the scale in the opening provided.

3) Draw the tape out until the horizontal bar is straight across the top of the respondent’s head. Be certain that the horizontal bar is touching the respondent’s head and that it is not simply on her hair.

4) Check the spirit level to be certain that the horizontal bar is really resting horizontally across the top of the respondent’s head.

5) Lock the tape measure in place.

6) Bring the locked tape measure to your eye level and record the height to the nearest tenth of a centimetre, for example: 140.3 cm. Do not round to 140.0 cm.

During training, each interviewer should measure every other interviewer. Space should be provided on a lined piece of paper so that successive measurements on one individual can be compared. Interviewers should practice until the inter-observer range of variability is no greater than a range between 0.3 kg. for weight and 0.3 cm. for height.

1.5.3 Quality control during field work

A. **Equipment**

The scales have to be calibrated at the beginning of the field work with a unit of known weight. Calibration to the same unit should be done once a day as indicated above. If the scales are dropped they should not be used until calibrated again. Normal handling will not drastically affect calibration. However, corrosion will cause problems if the scales are left in the rain; thus, care should be exercised to keep them dry. The same warning regarding water damage applies to the height measures.
B. *Interviewers*

It is recommended that members of each interviewing team weigh and measure each other approximately once a week to once a fortnight so the supervisor can check on inter-observer variability.
2. MODULE ON FACTORS OTHER THAN CONTRACEPTION AFFECTING FERTILITY

2.1 QUESTIONS TO BE ADDED TO SECTION 2

This question can follow ascertainment of pregnancy status, Q.221-223 (core, WFS/TECH.120), Q.226-228 (revised core, WFS/TECH.475):

Q.224(229) How old were you when you had your first menstrual period?

________________________  HAS NOT YET  B6  D.K. 87
(YEARS OLD)  BEGUN  

26
2.2 QUESTIONS TO BE ADDED TO SECTION 3

Beginning with questions 312 and 313, make the following changes:

- **Female Sterilization**
  - **Question 312:** Some women have an operation in order not to have any more children. Have you ever heard of this method? (Circle response in column 2.)
    - IF YES, IF NO, SKIP TO NEXT UNCIRCLED METHOD
  - **Question 313:** Interviewer: See 221 (226 revised core)
    - Currently pregnant \(\square\)
    - Not currently pregnant \(\square\)
    - (Skip to next uncircled method)
  - **Question 314:** Have you ever had such an operation?
    - YES \(\square\)
    - NO \(\square\)
    - (Skip to next uncircled method)
  - **Question 315:** Was one purpose of that operation to prevent you having any (more) children?
    - YES \(\square\)
    - NO \(\square\)
    - (Skip to next uncircled method)

- **Male Sterilization**
  - **Question 316:** Some men have an operation in order not to have any more children. Have you ever heard of this method? (Circle response in column 2.)
    - IF YES, IF NO, SKIP TO 319
  - **Question 317:** Interviewer: See 401, 405
    - Currently married \(\square\)
    - Separated, widowed, or divorced \(\square\)
    - (Skip to 319)
  - **Question 318:** Has your husband had such an operation?
    - YES \(\square\)
    - NO \(\square\)
    - (Go to 319)

*Note that the marriage history (Section 4 of the Core Questionnaire) must precede this section (contraceptive knowledge and use) when the module on Factors Other Than Contraception Affecting Fertility is incorporated into the questionnaire.*
319. Have you ever heard of any other methods which men or women use to avoid pregnancy?

<table>
<thead>
<tr>
<th>YES</th>
<th>NO</th>

506. **INTERVIEWER:** RECORD DATE OF BIRTH. PROBE AGAIN IF MONTH AND YEAR NOT STATED

(MONTH) 19 (YEAR) OR (YEARS AGO)

NAME ________________________ (IF AVAILABLE)
OPEN INTERVAL FOR EVER-MARRIED WOMEN WITH AT LEAST ONE PREGNANCY WHO ARE NOT CURRENTLY PREGNANT

507. Interviewer: Circle appropriate box (see 501)
- Currently pregnant 1
- Not currently pregnant or DK 2
  (Skip to 528)

Last pregnancy resulted in: (See 508)
- Live birth 1
- Non-living birth 2
  (Skip to 514)

508. Now I would like to ask you about the period since the birth of (NAME OF LAST CHILD, OR "your most recent child who later died"). Did you breast-feed (NAME OF LAST CHILD, OR "your most recent child")?
- Yes 1
- No 2
  (Skip to 512)

509. For how many months altogether did you breast-feed him/her?
Probe: How many months old was he/she when you completely stopped breast-feeding him/her?

(MONTHS) Still breast-feeding 8 – UNTIL HE/SHE DIED 8 – 7
  (Skip to 511) (Skip to 511)

510. After months had you completely stopped breast-feeding your child even once a day?
- Yes 1
- No 2
  (Correct 509 as necessary, then proceed to 511)

511. How many months old was the child when you began giving him/her additional food along with breast-feeding?

(MONTHS) No additional food given yet 8 – 1
  Child died before given 8 – 7
  Other foods

512. For how many months after the birth of this child did you go without sexual relations?
Probe: How many months old was the child when you resumed sexual relations?

(MONTHS) Not started yet 8 – 1
513. How many months after the birth of this child did your period come back?

___ (MONTHS) PERIOD NOT BACK YET [86]

(SKIP TO 516) (SKIP TO 516)

514. Now I would like to ask you about the period since the last time you were pregnant. For how many months after the end of this pregnancy did you go without sexual relations?

___ (MONTHS) NOT STARTED YET [86]

515. How many months after the end of this pregnancy did your period come back?

___ (MONTHS) PERIOD NOT BACK YET [86]

516. INTERVIEWER: CIRCLE APPROPRIATE BOX (SEE 401, 405)

YES   NO

(SKIP TO 531)  (SKIP TO 534)

530. Now I would like to ask you about the period after the birth of ______ (NAME OF NEXT-TO-LAST BIRTH, or "your next-to-last birth"). Did you breast-feed ______ (NAME, or "your child born before your last child")?

YES   NO

(SKIP TO 534)

531. For how many months altogether did you breast-feed him/her?

PROBE: How many months old was he/she when you completely stopped breast-feeding him/her?

(MONThs) UNTIL HE/SHE DIED 817

(SKIP TO 533)

532. After ______ months had you completely stopped breast-feeding your child even once a day?

YES   NO

(CORRECT 531 AS NECESSARY, THEN PROCEED TO 533)

533. How many months old was the child when you began giving him/her additional food along with breast-feeding?

(MONThs) CHILD DIED BEFORE GIVEN OTHER FOODS 817
LAST CLOSED INTERVAL

534. For how many months after the birth of this child did you go without sexual relations?

PROBE: How many months old was the child when you resumed sexual relations?

    (MONTHS)

535. How many months after the birth of this child did your period come back?

    (MONTHS)       PERIOD NEVER CAME BACK,        (MONTHS)
    (SKIP TO 539)   BECAME PREGNANT AGAIN     (SKIP TO 539)

536. Now I would like to ask you about the time since your last pregnancy. For how many months after the end of that pregnancy did you go without sexual relations?

    (MONTHS)

537. Now I would like to ask you about the time between your last two pregnancies. For how many months after the end of your next-to-last pregnancy did you go without sexual relations?

    (MONTHS)

538. How many months after the end of (that, your next-to-last) pregnancy did your period come back?

    (MONTHS)       PERIOD NEVER CAME BACK,        (MONTHS)
    (SKIP TO 538)   BECAME PREGNANT AGAIN     (SKIP TO 539)

539. INTERVIEWER: CIRCLE APPROPRIATE BOX (SEE 320, 501)

    (SKIP TO 543)

    (SKIP TO 541)

540. Have you or your husband used a method to keep you from getting pregnant at any time since your last pregnancy?

    (SKIP TO 542)    (SKIP TO 543)

541. Was there any time in the interval between your two pregnancies when you or your husband were using a method to keep you from getting pregnant?

    (SKIP TO 543)

542. What was the method you used? ______________________ (METHOD)
LAST CLOSED INTERVAL

543. During the time between your (last and current, last two) pregnancies were there any times when your husband worked away from home for three months or more?

YES 1  NO 2 (SKIP TO 560)

544. During this interval when were you temporarily apart for the first time for three months or more?

(MONTH) 19 (YEAR) OR (YEARS AGO)

INTERVIEWER: CHECK THAT DATE IS AFTER DATE IN 506 AND BEFORE DATE IN 503.

545. How many months were you apart for the (first, second,...) time?

546. During that time you were continuously apart without seeing each other, is that right?

YES 0 (.SKIP TO 560) NO (PROBE AND CORRECT)

547. Were you already pregnant when that absence began?

YES 1 (REPEAT 545-548) NO 2 (SKIP TO 560)

548. Were there any other times during the interval between your (last two, last and current) pregnancies when you were temporarily apart for three months or more?

(MONTH) 37 38 40

Yes 0 (SKIP TO 560) No (PROBE AND CORRECT)

Yes 1 (REPEAT 545-548) No 2 (SKIP TO 560)

(MONTH) 42 44

Yes 0 (SKIP TO 560) No (PROBE AND CORRECT)

Yes 1 (REPEAT 545-548) No 2 (SKIP TO 560)

2.5 WEIGHT AND HEIGHT

WEIGHT AND HEIGHT OF THE RESPONDENT ARE TO BE RECORDED AT THE END OF THE INTERVIEW. THUS, THE FOLLOWING INSTRUCTIONS SHOULD BE ADDED TO THE END OF SECTION 7 OF THE CORE QUESTIONNAIRE:

714. INTERVIEWER: RECORD WEIGHT AND HEIGHT OF RESPONDENT

WEIGHT: _ _ _ _ kg.

HEIGHT: _ _ _ _ cm.

715. INTERVIEWER: CIRCLE APPROPRIATE BOX

RESPONDENT'S CLOTHING:

LIGHT WEIGHT 1 MEDIUM WEIGHT 2 HEAVY WEIGHT 3
Family Planning Module

1 INTRODUCTION*

The term family planning covers activities designed to limit fertility and activities to increase fertility, especially the treatment of subfecundity. Family planning as a fertility stimulating activity will not be considered separately in this module.

Within the framework of WFS, family planning variables are recommended to be considered only insofar as they may help to explain fertility levels and differentials in a reasonably direct way. Therefore, variables explaining the knowledge and use of contraceptives in the population will not be considered in any detail, and the chain of events which leads to contraceptive knowledge and use is cut short. The module concentrates mainly on four aspects of family planning:

1) Knowledge of contraceptive methods,
2) Use of contraceptive methods,
3) Accessibility of family planning places and cost of certain methods, and
4) Knowledge and use of the places where family planning advice and supplies can be obtained.

The selection of these four aspects is based on the fact that, in order for a woman to use a contraceptive, she first has to know about the contraceptive; second (in the case of supply methods like the pill, IUD, condom, diaphragm, etc.), she must know where to obtain it; and third, be able to obtain it.

Any country actively interested in family planning, and particularly one with a large family planning programme, may have a need for more extensive information on factors relating to contraceptive knowledge and the effectiveness of programme activities. It may seem tempting to seek such information through the WFS Family Planning Module. However, it is important to look very carefully at this proposal and more especially at the question of the sample size. Do programme activities reach a high proportion of the population? Is the extent of use of certain methods sufficient to justify the calculation of efficacy rates? In many cases, the sample size will simply not be big enough to justify the collection of very detailed information for sub-groups of the population such as those covered by the family planning programme or those having used a certain method of contraception. In any case, in many countries most of the wanted information may already be available from other sources, such as service statistics, follow-up surveys of acceptors and non-acceptors, use-effectiveness studies of certain methods, and so on.

As it stands, the module does not take account of the fact that different countries have widely varying types of family planning activities. Some countries have family planning programmes,

* Whenever in this module reference is made to the 'Core Questionnaire', this implies both the Questionnaire as such and the Modifications to Core Questionnaire for countries of high fertility and low contraceptive usage, WFS/TECH. 475 Basic Documentation No. 1.
other do not; some countries use mobile clinics, others do not; some countries use field
workers, others do not; etc. All questions and codes relating to institutions or persons
involved in family planning services should therefore be adapted to take into account the
specific situation in each country. This adaptation should consider both programme and
non-programme activities.

2 CONTENTS OF THE MODULE

The module consists of extensions of Section 2 and Section 3 of the Core Questionnaire and
the Fertility Regulation Module. It can readily be inserted into the Core Questionnaire by
replacing Sections 3 and 5 with the two corresponding parts of the module, and by adding
three questions to Section 2.

Apart from those parts of the module corresponding to Section 3 of the Core Questionnaire
and the Fertility Regulation Module, the following information is obtained.

2.1 SECTION 2

<table>
<thead>
<tr>
<th>Question</th>
<th>Usefulness of the information</th>
</tr>
</thead>
<tbody>
<tr>
<td>A. Duration of absence of sexual relations after the birth of the last child</td>
<td>239</td>
</tr>
</tbody>
</table>

2.2 SECTION 3

<table>
<thead>
<tr>
<th>Questions</th>
<th>Usefulness of the information</th>
</tr>
</thead>
<tbody>
<tr>
<td>A. Whether contraceptives are currently available in the home</td>
<td>304a, 306a, 308a</td>
</tr>
<tr>
<td>B. At what stage in her reproductive life cycle the woman started using contraception, and with which method</td>
<td>318, 320</td>
</tr>
</tbody>
</table>
use provides a rough but valuable measure about the importance of contraceptive behaviour in a population or sub-population and, together with last use, provides a useful measure of periods of use of contraception.

These questions will provide valuable information about the accessibility of supply methods in the population under study and, at the same time, information about the knowledge of places where specific contraceptive methods can be obtained. This will provide an indication of the proportion of women who have ever gone for family planning help and advice.

This will provide a measure of the importance of each of the places and persons during the last year. A crude evaluation of the services will be obtained for those women who have visited a place in the last twelve months.

An indication will be obtained about the reasons why women who know of places or persons which provide family planning services have not visited them in the last year.

2.3 SECTION 5

The additional questions to be included in the Fertility Regulation Module are incorporated in each section of that module except for questions 5601-5611 which are inserted at the end of the module.

The contents of additional questions contained in different sections of the Fertility Regulation Module can be distinguished according to whether the woman has ever used any method of contraception.
A. In the case of never-users (except for those who cannot have more children and those not living with their husbands), the questions cover the following:
1) Whether the woman approves of the use of contraceptive methods.
2) Whether the husband approves of the use of contraceptive methods.

B. In the case of women who have used a contraceptive, the questions cover the following:
1) Duration of contraceptive use in open and closed intervals.
2) Last method used in those intervals.
3) Reasons for stopping use in those intervals.

C. 5601–5611. Detail about last method used.

These questions provide the following information:
1) Programme and non-programme users can be distinguished.
2) Bottlenecks in the contraceptive supply system, or other use-limiting factors can be pinpointed.
3) Duration of use for the current or last method is obtained.
4) Information is obtained about the change of methods and the reasons for changing.*

Usefulness of the information
These questions shed more light on the intentions of never-users, as it will make it possible to pinpoint whether the woman, the husband, or both, are against the use of contraceptives.

Usefulness of the information
Apart from its use in the study of intervals, this information will provide insight into the adequacy of certain contraceptive methods in the population, and can pinpoint crucial time periods for the continuation of use of these methods.

* A tabulation programme is currently being established for the variables covered in the Family Planning Module. It will be available separately.
In Section 5, specific instructions to the interviewers must be included in the Interviewers' Instructions with respect to the use of abstinence as a method of contraception — both with respect to determining what abstinence is, and with respect to the treatment of certain questions which do not make sense in the case of abstinence. If abstinence as a contraceptive method is thought to be widespread, specific instructions should be included in the questions themselves.
THE FOLLOWING QUESTIONS ARE TO BE ADDED TO SECTION 2:

238. INTERVIEWER: CIRCLE APPROPRIATE BOX (SEE 216)

NO LIVE BIRTHS [ ]
ONE OR MORE LIVE BIRTHS [ ]
(SKIP TO 240)

239. After the birth of your (last) child, how many months was it before you started having sexual relations again?

[MULTIPLE CHOICE]
(MONTHS)

240. RELIABILITY OF ANSWERS IN SECTION 2:

GOOD [ ]
FAIR [ ]
POOR [ ]

241. PRESENCE OF OTHERS AT THIS POINT (CIRCLE ALL THAT APPLY)

NO OTHERS [ ]
CHILDREN UNDER 10 [ ]
HUSBAND [ ]
OTHER MALES [ ]
OTHER FEMALES [ ]

SECTION 3: CONTRACEPTIVE KNOWLEDGE AND USE

301. Now I want to talk about a somewhat different topic. As you may know, there are methods that couples can use to avoid a pregnancy if they want to. This is called family planning. Do you know of, or have you heard of any of these ways or methods to avoid pregnancy?

YES 1  
NO 2  
(Skip to instruction above 304)

302. Which methods do you know of?

PROBE: Do you know of any others?

INTERVIEWER: Record answer, and then proceed to circle box(es) in Col. 1 corresponding to the method(s) mentioned. For each method so circled, except sterilization, ask:

303. Have you ever used (method)?

(Refer to method in same words used by interviewer in Col. 1 corresponding to the particular method)

Now ask 304-314, in turn, skipping those methods circled in Col. 1. Preface the questioning with:

There are some other methods which you have not mentioned, and I would like to find out if you might have heard of them.

FOR THOSE WHO SAID "NO" TO 301, PREFACE Q.304 WITH:

Just to make sure, let me describe some methods to see if you have heard of them.

<table>
<thead>
<tr>

General Mortality Module

INTRODUCTION

The standard form of the WFS Household Schedule, designed to be used for listing household members prior to selection of women for individual interview, is closely similar to the type of schedule used for censuses and simple demographic surveys throughout the developing world. It is thought that certain countries lacking adequate death registration may wish to take the opportunity offered by this household interview to collect simple data on mortality. To meet this potential demand, and also because of the possible relevance of mortality levels to fertility, the WFS has prepared a module consisting of a variant of the WFS Core Household Schedule, for the purpose of measuring mortality in participating countries where there are no adequate alternative sources of information on mortality.

Mortality questions are in the block in the top right hand corner of the expanded Household Schedule, and Columns (11) to (16) of the schedule itself. The block asks for deaths of household members during the preceding 24 months, by sex and age. When tabulated by months of occurrence, it is possible to extract the deaths occurring during the preceding 12 months. The advantage of asking for deaths in the last 24 months is that it facilitates the study of

1) incidence of deaths by time periods, reflecting progressive recall lapse; and

2) dating errors, which may be reflected in heaping of deaths in certain months such as the 13th. This could arise from the respondent replying 'About a year ago' in answer to the question on date of death.

The question on date of death also provides a safeguard against complete misunderstanding of the mortality question. Such misunderstanding has sometimes been evident in the fact that all dead children reported in Columns (21) and (22) are included in the 'current' deaths. Even if, as is more than likely, there is a general under-reporting of deaths in the last 12 or 24 months, the data can still be used to obtain an indirect estimate of the death rate by the Brass method which utilizes the proportionate distribution of deaths by age in conjunction with the age distribution.1

Columns (11) and (12) on survival of first spouse should enable derivation of indirect estimate of adult mortality. Techniques are available for converting the data into life table survivorship probabilities.

Alternative estimates of adult mortality may also be obtained from the questions on survival of parents in Columns (13) and (15). These questions have yielded plausible and consistent estimates of mortality in several developing countries2. However, possible bias due to correlation between the mortality of the parent and the number of offspring reporting on the same parent cannot be ignored. To combat this, a separate analysis of parent survival for eldest

---

1 'Note on a method of estimating mortality from distribution of deaths and population by age without knowledge of the relation of absolute numbers' presented to the 1973 IUSSP Conference, Liège.
living children only may be made using the data obtained in Columns (14) and (16). The requisite analytical techniques have been drawn up at the London School of Hygiene and Tropical Medicine.³

Estimates of infant and child mortality may be derived from proportions dying among children ever born, tabulated by age of mother, using the techniques devised by Brass and Sullivan.⁴ Alternative estimates may also be obtained from the question on the survival of the most recent live birth in Column (27), though this question has been included more as a check to ensure that the right birth is reported in answer to the question on the date of the last birth in Columns (24) and (25).

The questions on the number of children who have died and on survival of the most recent live birth have been asked in many countries where death registration is inadequate or non-existent. Although these questions have often provided better information on mortality than any previously available, the limitations and errors of the data are well known. The questions on orphanhood and survivorship of first spouse were developed in an effort to obtain more reliable data. These questions have been asked largely in African countries (e.g., Kenya, Uganda, Cameroon, Chad, Mauritania), but also in Latin America (e.g., Honduras) and the Pacific.

To obtain further information on mortality, a new approach based on the survival of siblings has been developed at the London School of Hygiene and Tropical Medicine, together with appropriate analytical techniques. This has not yet been tested in the field but the following questions are suggested to countries wishing to use it:

<table>

</table>

The four columns needed for this information may be inserted at the end of the Mortality section of the attached module after Column (16). The two questions above may, if desired, be modified specifically to exclude the respondent from the mother’s offspring. Whether the respondent is included or not is unimportant provided, of course, it is known which method has been used. Furthermore, without seriously reducing their usefulness, these questions could, if desired, be asked only of adults and of children above a certain age, or even of adults alone.

Now we would like some information about the people who ordinarily live in your household, or are staying with you now.
